

Natural vision Scene understanding, object recognition, motion analysis are capabilities in animals resulting by a holistic process, where an image is built by also exploiting all the other senses exploitable in that particular context Experience plays a key role to understand what is being watched. Human beings know how a tree is made, from the abstract point of view – trunk, branches, leaves – and recognize an object as being a tree even though they have not ever seen that specific tree before Context analysis provides crucial information regarding the probability that a given object could be in the scene, showing a given behavior, affecting its recognition
